

Publication List and Sample Publications

In this document I collect my full publication list (also contained in my CV) as well as five important recent sample publications that demonstrate my work:

- *Costa, D., Bezemer, C.-P., **Leitner, P.**, and Andrzejak, A. Whats wrong with my benchmark results? Studying bad practices in JMH benchmarks. IEEE Transactions on Software Engineering (2020). To appear.*
 - A recent example publication demonstrating experimental work on JMH benchmarking, which we have conducted in an international collaboration. TSE is the highest-reputation journal in software engineering.
- *Laaber, C., Würsten, S., Gall, H. C., and **Leitner, P.** Dynamically reconfiguring software microbenchmarks: Reducing execution time without sacrificing result quality. In Proceedings of the 28th ACM Joint Meeting on European Software Engineering Conference and Symposium (ESEC/FSE 2020)*
 - Another publication pertaining to JMH benchmarking. The paper proposes a new approach to reduce benchmarking times with the goal of integrating microbenchmarking into continuous integration pipelines. The first author was my doctoral student at the time of writing, and ESEC/FSE is one of the two A*-ranked software engineering conferences.
- *Erlenhov, L., Neto, F., and **Leitner, P.** An empirical study of bots in software development: Characteristics and challenges from a practitioners perspective. In Proceedings of the 28th ACM Joint Meeting on European Software Engineering Conference and Symposium (ESEC/FSE 2020)*
 - This publication illustrates more empirical and qualitative research (a combined interview and survey study on the usage of bots in software development). This paper has also appeared in ESEC/FSE, the first author is a current doctoral student in my research group at Chalmers.
- *Cito, J., **Leitner, P.**, Rinard, M., and Gall, H. C. Interactive production performance feedback in the IDE. In Proceedings of the 41st International Conference on Software Engineering (ICSE 2019)*
 - This work showcases our research on visualizing performance data for developers. The paper discusses an empirical evaluation using a controlled experiment. Jürgen Cito was my doctoral student at the time when the research has been primarily conducted. ICSE is the premier conference of software engineering.
- ***Leitner, P.**, and Cito, J. Patterns in the chaos - a study of performance variation and predictability in public IaaS clouds. ACM Transactions on Internet Technology 16, 3 (Apr. 2016), 15:1–15:23.*
 - This is a highly impactful paper assessing performance variations in real-life clouds (approximately 170 citations since 2016). While not directly a software engineering publication, much of my current research is related to bringing the idea of performance evaluation and prediction into the mainstream of software engineering research. Hence I consider this publication to be a cornerstone of my current software engineering research work.
